

## CREDENTIAL RISK DETECTION

# Uncover hidden credential threats

Get visibility into every weak and compromised employee credential across your organization, even if users never activate their Dashlane accounts, to better understand your security risks.

## Mitigate breaches with easy access to risk data

### BREACH MITIGATION

#### Challenge

The increasing reliance on cloud services and rise of shadow IT are creating a visibility gap for IT admins and security teams. This lack of oversight increases the risk of at-risk credentials, leaving organizations vulnerable to breaches and limiting data protection.

#### Solution

Credential Risk Detection gives IT admins proactive risk insights to mitigate data breaches.

- Monitors and detects at-risk employees regardless of a Dashlane account or password manager usage.
- Provides granular employee-level credential risk data.
- Identifies domain-level logs of weak and compromised credentials.

### ACCESS TO RISK DATA INSIGHTS

#### Challenge

IT and security teams in sensitive industries, such as finance and healthcare, often lack risk data, making it difficult to justify security budgets and build a strong business case for procuring credential security tools.

#### Solution

Centralized reporting for IT teams to measure credential risks and mitigate unauthorized access to sensitive data.

- Provides aggregate employee risk data on weak and compromised passwords.
- Monitors credential usage across employee managed devices, browsers and work applications.
- Enables targeted security measures for breach prevention.
