

# Prompt employees to take action

Employees get automated, real-time alerts in Slack or their browser extension when they have a weak or compromised password so they can self-remediate—no IT effort required.

## How it works:

If a member has one or more compromised passwords, Dashlane automatically sends an alert encouraging the employee to create more secure and unique passwords.

## Benefits:

### Automated nudge

Leverage the power of automation to improve your organization's security posture.

### Security risk awareness

Communicate credential risks through the Slack messaging app or Dashlane extension.

### Employee empowerment

Empower employees to strengthen their passwords on their own and right away.

“Nudges provide the right level of guidance without creating friction, and employees respond positively.”

*Adrian Vasile Ciorba, IT Engineer at Owkin*

Empower employees to make smarter security decisions
