

Turn risk alerts into action

Traditional password management solutions only monitor the vault, creating blind spots.

With Credential Risk Alerts & Notifications, employees get real-time alerts when they attempt to sign in to a website with a weak or compromised credential, whether or not it's stored in a vault. The alerts prompt employees to change the credential and secure the account, improving credential security behavior across the workforce.

Credential Risk Alerts & Notifications provide enterprises with:

Automated response

Prompt employees to immediately fix weak and compromised passwords with clear, simple guidance—no extra work required from IT.

Security insights

Gain valuable data on risk detection and user response, tracking the effectiveness of the alerts and how your company security strengthens.

Employee empowerment

Make security a daily habit, not just a yearly training, with contextual alerts that show employees their risks and exactly how to fix them.

“[The alerts] provide the right level of guidance without creating friction.”

Adrian Vasile Ciorba, IT Engineer at Owkin

Automate employee risk response with Dashlane Omnix™
