

SINGLE SIGN-ON

Why SSO Isn't Enough to Secure an Organization

57%

of employees' work passwords aren't protected by SSO.

50%

is the average amount of SaaS services unprotected by SSO that employees admit to using.

39%

of employees use apps not managed by their company on work devices.

SSO is just one piece of the security puzzle

→ SSO simply doesn't provide enough coverage

SSO doesn't cover all the apps and credentials used in most workplaces. This is often due to shadow IT, SaaS apps simply not supporting SSO, or SaaS apps charging a lot for it.

→ Organizations need a universal solution

Credential managers work with every online service and app. By complementing SSO with a credential manager, you enable employees to store and manage all their credentials in a centralized, secure location.

“It was alarming to see the degree of shadow IT.”

Ben Leibert, Technical Manager, VillageReach
